(54) Apparatus for chemical analyses

(57) An apparatus for the chemical analyses of substances, e.g. for use in blood grouping comprises:
a loading station (10) for receiving a series of carrier racks (18) each for a plurality of test tubes (19) each of which tubes contains a sample of the substance to be analysed; a first dispensing unit (11) for dispensing a required amount of reagent liquid into each of the test tubes in the carriers; a

second dispensing unit (14) for dispensing a metered amount of chemical agent into each of the test tubes; a reading unit (16) comprising a photometric system to pass beams of light through the test tubes, and light-sensitive means (62) for sensing the light transmitted through the test tubes; an unloading station (17) for discharging the test tube-containing carriers; and, a print-out unit (68) to deliver printed analyses of the analytical results derived from the reading unit.

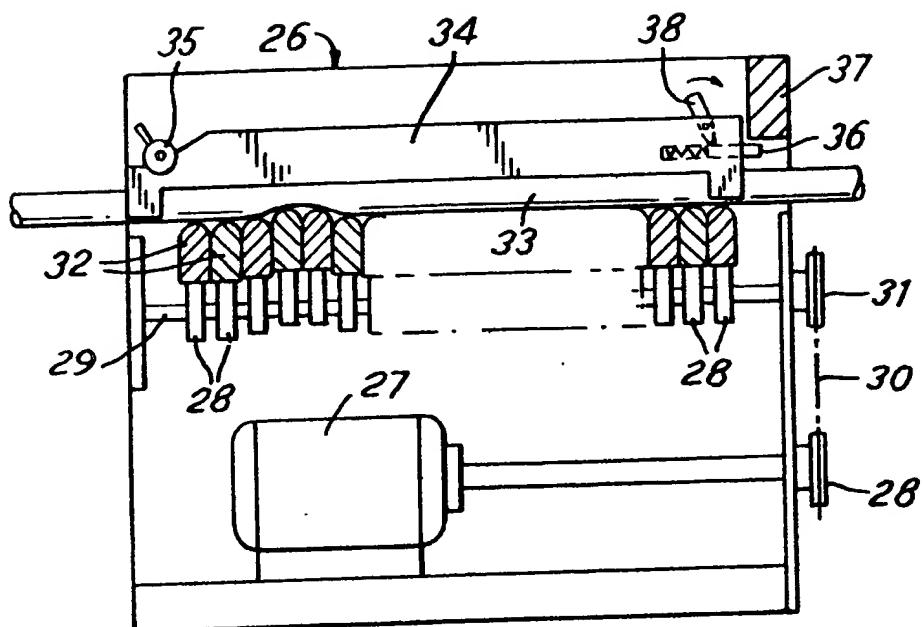

FIG. 4

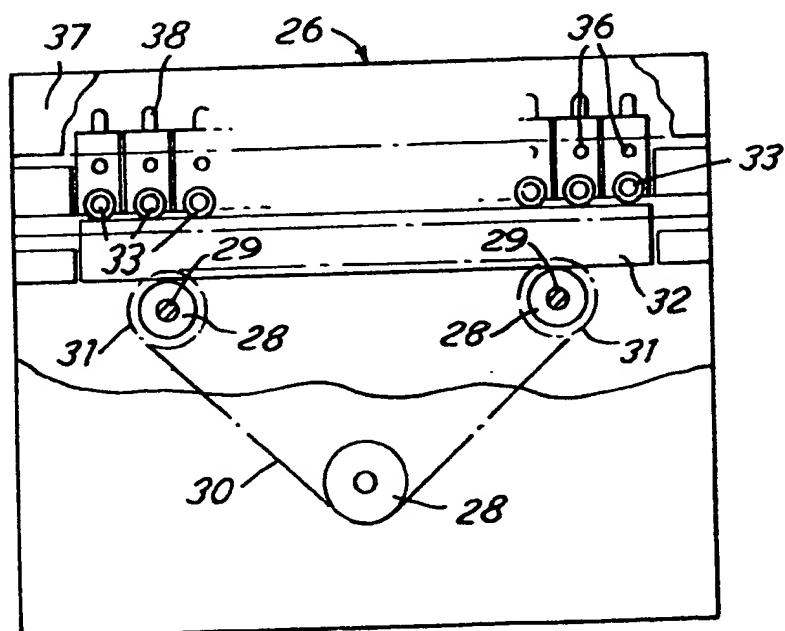

FIG. 5

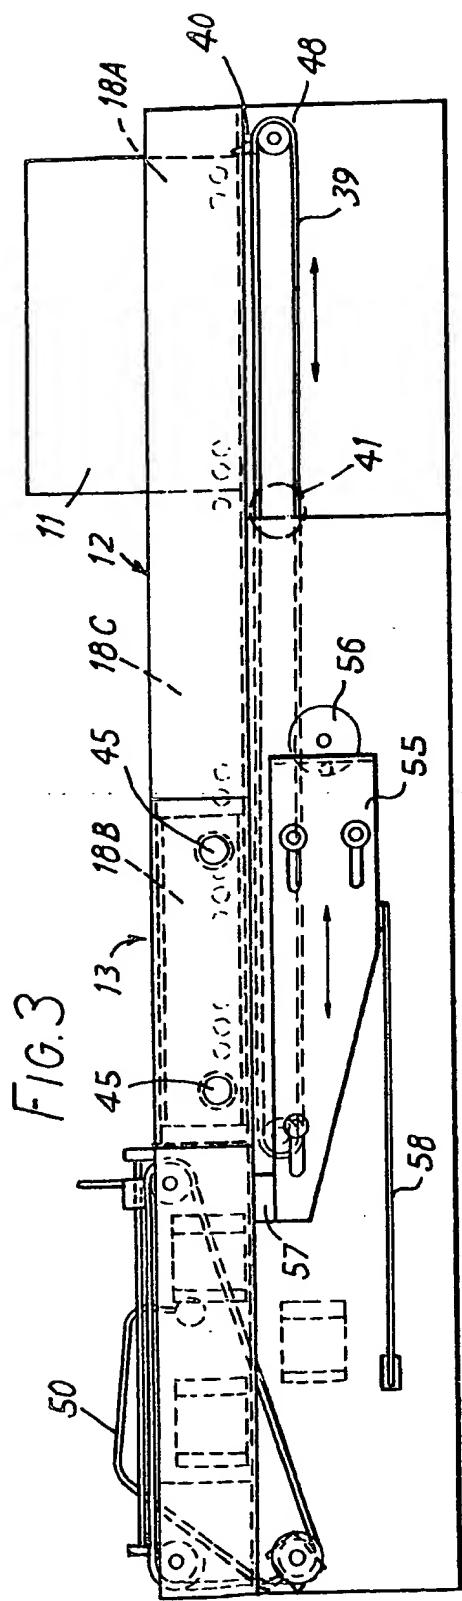

FIG. 3

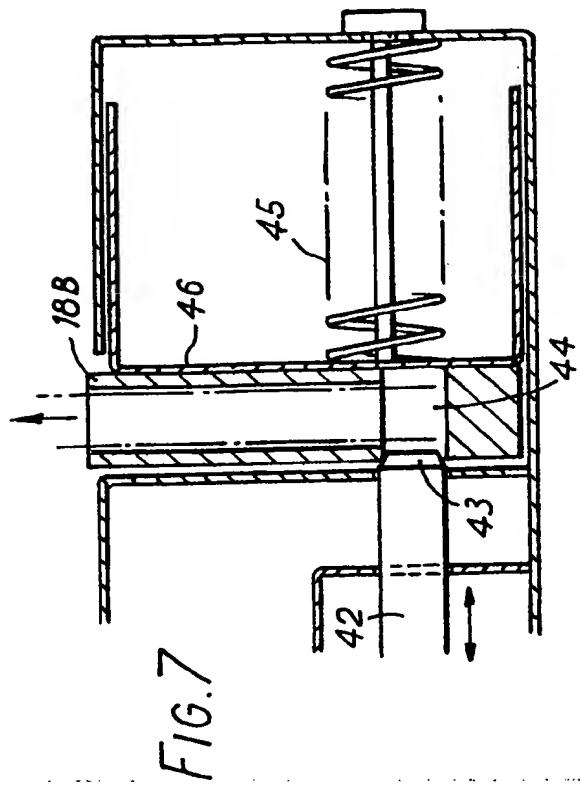

FIG. 7

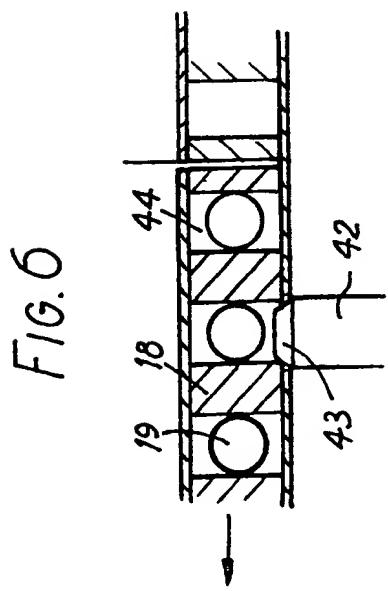

FIG. 6

SPECIFICATION**Apparatus for chemical analyses, particularly for use in blood grouping**

This invention relates to apparatus for chemical analyses and particularly, but not exclusively, for use in blood grouping.

Various forms of apparatus for blood grouping have previously been proposed such as in U.S. Patents Nos. 3,334,018, 3,624,223, 3,432,268, 10 4,104,031 and 4,130,395. However, various disadvantages are involved in all these prior machines, and it is an object of the present invention to provide an improved apparatus in which these disadvantages are at least reduced.

15 The essential features of one embodiment of apparatus according to the present invention include:

- a) A loading station for receiving a carrier for a plurality of test tubes or like receptacles, each tube containing a sample of the liquid suspension;
- b) a first dispensing unit for dispensing the required amount of reagent liquid into each of the test tubes in the carrier;
- c) a second dispensing unit for dispensing a metered amount of biochemical agent possibly as defined below into each of the test tubes;
- d) a reading unit comprising a photometric system to pass beams of light through the test tubes, and light-sensitive means for sensing the light transmitted through the test tubes;
- e) an unloading station for discharging the test tube-containing carriers; and
- f) transport means for transporting the carriers from the loading station through the dispensing units, and the reading unit, to the loading station.

The aforementioned biochemical agent may comprise from 0.1 to 1.0 g/l of a nonionic surface-active agent which is a water soluble protein-compatible anionic detergent, in an aqueous isotonic buffered solution which has a pH value of from about 6.5 to 8.0 and exhibits an osmolarity of from 300 to 400 milliosmol/kg, a sodium content of about 125 to 225 milliequivalents/l, and a potassium content of from about 3.5 to 7.5 milliequivalents/l. Preferably, the nonionic surface-active agent is a polyoxyethylene ether of C₁₂—C₁₆ alkyl alcohol containing from about 20 to 25 oxyethylene units.

However, the various features of the apparatus have applications other than to blood grouping or even immunological analyses; embodiments and features of the present invention will now be described, by way of example, with reference to the accompanying drawings in which:

55 Figure 1 is a perspective view showing an apparatus for use in immunological analysis, and specifically applicable to blood grouping;

Figure 2 is a plan view corresponding to Figure 1;

60 Figure 3 is a rear view of the apparatus shown in Figures 1 and 2;

Figures 4 and 5 are diagrammatic side and rear elevations showing a pump unit for anti-sera;

Figure 6 is an enlarged section on the line VI—

VI of Figure 2; and, Figure 7 is a detail on the line VII—VII of Figure 2.

Referring to Figures 1 and 2 of the drawings, the apparatus consists essentially of a loading station 10, a first dispenser unit 11 for anti-sera, a delay station 12, an agitator unit 13, a second dispensing unit 14 for the biochemical agent, a stepwise progression unit 15, a reading unit 16, and an unloading station 17.

75 In use of the apparatus, carrier racks 18 containing up to twelve test tubes 19 are fed manually to the loading station 10, and the racks are drawn to a position below spouts 20 of the dispenser unit 11 by means of a reciprocating console 21 which carries side rows of spring-loaded driving pawls 22. The console is reciprocated by means of an electric motor (not shown) driving a rotary disc 23 and con-rod 24 which is pivotally connected to the underside of 80 the console.

At the dispensing unit 11, identical quantities of different anti-sera are introduced simultaneously through the spouts 20 into (in this case, seven of the twelve) test tubes of rack 18A

90 by means of a novel peristaltic pump unit which is shown in Figures 4 and 5. The pump unit 26 has an electric motor 27 driving a first pinion 28 which rotates a pair of cam shafts 29 through a chain 30 and a pair of pinions 31. The shafts 29 carry pairs of aligned cam surfaces which cause shaped transverse rods 32 to oscillate vertically in a wave-like manner. Twelve flexible tubes 33 are individually carried by shaped supports 34 to be sandwiched between the rods and the supports

move the two racks a short distance apart. The left-hand spigot does not reciprocate.

After agitation for a period of 30 seconds, and then a delay of 45 seconds, the rack (18B) is

- 5 moved to the second dispensing unit 14 where a movable spout 47 dispenses identical quantities of the biochemical agent, fed by a pump at 48, into each of the first seven tubes, in timed sequence. A tube-counting sensor 49 is provided
- 10 to prevent dispensing of a possibly corrosive fluid into an absent tube at unit 14. In this position (18D) the rack is held against forward tilting by means of a pivotal arm 50 which carries a low-friction plastics ball 51 at its distal end. After the
- 15 dispensing stage 14, the rack 18D is moved towards the reading unit 16 by means of coupled pivotal levers 52 to adjacent delay position 18E and then by pushers 53 to further and relatively close delay positions 18F and 18G, before being
- 20 carried by swivel fingers 54 the relatively greater distance into precise alignment with the reading unit 16.

Referring to Figure 3, a rear plate 55 is reciprocated by an electric motor 56 to operate the pushers and lever arms through a first connecting member indicated at 57 and, through a second connecting rod 58, to reciprocate a horizontal plate 59 (Figure 2) which coacts with a lever 59A. The plate 59 rises and falls to move

- 25 the pushers and the lever arms into and out of the path of the racks in the progression unit 15.

At the reading unit, a two-arm reciprocating roller-guided carriage 60 carries a solid-state laser-type beam emitter 61 to direct beams of light successively through each pair of openings 44 in the rack and thus through the lower parts of the test tubes 19 which contain the liquid solution. A PIN photo-diode sensor 62 simultaneously moves behind the rack to take

- 30 photometric readings from the beam flashes which are of very short duration. The sensor is also employed to compensate for varying ambient light levels. A preferred light source is a high-intensity LED emitting at 565 m μ (green) which is
- 35 acceptably close to the 545 m μ which is preferred for scanning blood sample agglutinations, without employing filters at the emitter or sensor. The LED is of attractively small size, eliminating the need for a projection lens
- 40 system, and has the further advantages of giving a narrow spread of light, using low power, emitting little heat, and requiring low
- 45 maintenance. Also, the capacity for high-speed on/off operation allows ambient light to be sensed

- 50 without the use of a chopper wheel as is required in a tungsten-lamp system.
- 55 An alternative light-emitter system is a conventional lamp with a chopper and filter sited in a convenient part of the apparatus and having a fibre-optic connection to the emitter head. As shown in Figure 2, electric motor 63 drives a shaft 64 to reciprocate the carriage 60, and also a shaft 65 to swing the pivotal arm 50 and move the spout 47.

65 After the reading stage (18H), the rack is

moved to the unloading station by means of further lever arms 66 and the racks then collect at the unloading station 17 for suitable removal.

- As a further feature of the invention, the racks
- 70 18 carry bar-code identifications, suitably on adhesive labels 67 (Figure 1) which are also sensed at the reading unit 16. The results of the photometric tests are then fed into a suitable microprocessor and the analyses are delivered in printed form, together with the identification of the blood sample, at print-out unit 68 on control panel 69.
 - 75

Modifications may be made without departing from the scope of the invention and, as indicated above, the inventive concepts of, for example, the peristolic pump unit, the LED emitter and sensor or the fibre-optic system, the reciprocating pawl drive arrangement, and the agitator unit, may have useful applications in apparatus other than

- 80 for blood grouping or even chemical analysis.
- 85

Claims (filed 29.3.82)

1. An apparatus for use in the chemical analyses of substances, comprising:
a loading station for receiving a carrier for a plurality of test tubes or like receptacles, each tube containing a sample of the substance to be analysed;
a dispensing unit for dispensing a required amount of reagent into each of the test tubes in the carrier;
 - 90
 - 95
 - 100
 - 105
 - 110
 - 115
 - 120
 - 125
 4. An apparatus as claimed in any preceding
- a reading unit comprising a photometric system to pass beams of light through the test tubes, and light-sensitive means for sensing the light transmitted through the test tubes;
- an unloading station for discharging the test tube-containing carriers; and,
- transport means for transporting the carriers from the loading station through the dispensing unit, and the reading unit, to the loading station.
2. An apparatus for use in the chemical analyses of liquid suspensions, comprising:
a loading station for receiving a carrier for a plurality of test tubes or like receptacles, each tube containing a sample of liquid suspension;
- a first dispensing unit for dispensing a required amount of reagent liquid into each of the test tubes in the carrier;
- a second dispensing unit for dispensing a metered amount of chemical agent into each of the test tubes;
- a reading unit comprising a photometric system to pass beams of light through the test tubes, and light sensitive means for sensing the light transmitted through the test tubes;
- an unloading station for discharging the test tube-containing carriers; and,
- transport means for transporting the carriers from the loading station through the dispensing units and the reading unit, to the loading station.
3. An apparatus as claimed in claim 1 or Claim 2, in which said carrier comprises a horizontal rack for carrying a row of test tubes in upright positions.

- claim, in which said transport means include drive means to transport said carrier and subsequent similar carriers from said loading station to said (first) dispensing unit, said drive means
- 5 comprising a console arranged to reciprocate in a generally horizontal plane and carrying side rows of spring-loaded pawls to engage the ends of the carrier.
5. An apparatus as claimed in any preceding
- 10 Claim, in which said (first) dispensing unit comprises a peristaltic pump in which a row of flexible feed tubes are acted upon by a series of transverse rods which reciprocate in succession against the tubes to pump similar quantities of liquid along the feed tubes to dispensing spouts.
- 15 6. An apparatus as claimed in Claim 5, in which said rods are reciprocated under the action of spaced parallel cam shafts, the cams of which rotate to provide a wave-like effect.
- 20 7. An apparatus as claimed in any preceding Claim, in which an agitator unit for agitating said test tubes is provided between said (first) dispensing unit and said reading unit.
8. An apparatus as claimed in Claim 7, in
- 25 which said agitator unit comprises horizontal spigot members which engage a test-tube carrier in the agitator unit, raise the carrier slightly from a base support, reciprocate the carrier transversely, and lower the carrier back onto the base support.
- 30 9. An apparatus as claimed in Claim 8, in which, in said agitator unit, the carrier is sandwiched between said spigot members and a spring-loaded vertical plate.
10. An apparatus as claimed in any of Claims 6
- 35 to 8, in which a delay station is provided between said (first) dispensing unit and said agitator unit, and a stabilising spigot member is arranged to engage and isolate from a reciprocating test-tube carrier in said agitator unit, a test-tube carrier in the delay station.
- 40 11. An apparatus as claimed in any preceding Claim, in which a test-tube counting sensor is
- provided at said first and/or said second dispensing unit.
- 45 12. An apparatus as claimed in any preceding Claim, in which said transport means includes a drive arrangement for transporting said carrier and subsequent carriers from said (second) dispensing unit to said reading unit, the drive
- 50 arrangement comprising pivotal levers and pushers which move the carriers from the (second) dispensing unit to adjacent delay positions, and swivel-fingers which move the carriers from the delay positions a relatively
- 55 greater distance to the reading unit, the levers and pushers being mounted on a reciprocating plate which rises and falls to move the levers and pushers into and out of the path of the carriers.
- 60 13. An apparatus as claimed in any preceding Claim, in which said reading unit has a reciprocating carriage carrying firstly a laser beam emitter to direct beams successively through openings in the carrier and thus through lower parts of the test tubes, and secondly a sensor to receive and take photometric readings from the beams which have passed through the test tubes.
- 65 14. An apparatus according to any preceding Claim, and further comprising a micro-processor arranged to receive signals from said reading unit, analyse the signals, and print out the results of the analysis.
- 70 15. An apparatus as claimed in Claim 14, in which each carrier is provided with a bar-code the identification from which is fed to said micro-processor.
- 75 16. An apparatus for use in chemical analysis, substantially as hereinbefore described, with reference to the accompanying drawings.
17. A method of chemical analysis,
- 80 substantially as hereinbefore described with reference to the accompanying drawings.
18. The features herein described, or their equivalents, in any novel selection.

37 CFR 1.97. Filing of information disclosure statement.

- (a) In order for an applicant for a patent or for a reissue of a patent to have an information disclosure statement in compliance with § 1.98 considered by the Office during the pendency of the application, the information disclosure statement must satisfy one of paragraphs (b), (c), or (d) of this section.
- (b) An information disclosure statement shall be considered by the Office if filed by the applicant within any one of the following time periods:
- (1) Within three months of the filing date of a national application other than a continued prosecution application under § 1.53(d);
 - (2) Within three months of the date of entry of the national stage as set forth in § 1.491 in an international application;
 - (3) Before the mailing of a first Office action on the merits; or
 - (4) Before the mailing of a first Office action after the filing of a request for continued examination under § 1.114.
- (c) An information disclosure statement shall be considered by the Office if filed after the period specified in paragraph (b) of this section, provided that the information disclosure statement is filed before the mailing date of any of a final action under § 1.113, a notice of allowance under § 1.311, or an action that otherwise closes prosecution in the application, and it is accompanied by one of:
- (1) The statement specified in paragraph (e) of this section; or
 - (2) The fee set forth in § 1.17(p).
- (d) An information disclosure statement shall be considered by the Office if filed by the applicant after the period specified in paragraph (c) of this section, provided that the information disclosure statement is filed on or before payment of the issue fee and is accompanied by:
- (1) The statement specified in paragraph (e) of this section; and
 - (2) The fee set forth in § 1.17(p).
- (e) A statement under this section must state either:
- (1) That each item of information contained in the information disclosure statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of the information disclosure statement; or
 - (2) That no item of information contained in the information disclosure statement was cited in a communication from a foreign patent office in a counterpart foreign application, and, to the knowledge

of the person signing the certification after making reasonable inquiry, no item of information contained in the information disclosure statement was known to any individual designated in § 1.56(c) more than three months prior to the filing of the information disclosure statement.

(f) No extensions of time for filing an information disclosure statement are permitted under § 1.136. If a bona fide attempt is made to comply with § 1.98, but part of the required content is inadvertently omitted, additional time may be given to enable full compliance.

(g) An information disclosure statement filed in accordance with section shall not be construed as a representation that a search has been made.

(h) The filing of an information disclosure statement shall not be construed to be an admission that the information cited in the statement is, or is considered to be, material to patentability as defined in § 1.56(b).

(i) If an information disclosure statement does not comply with either this section or § 1.98, it will be placed in the file but will not be considered by the Office.
